

People die from severe allergies everyday from various foods, medicine, insects and exercise.

The importance of having epinephrine auto injectors quickly available is essential. One life lost to anaphylaxis is too many. Death is preventable with timely administration of epinephrine and it is unrealistic to have complete allergy free zones. We should strive to emulate the initiative of Sussex, NB where publicly available EAIs have been distributed throughout the community.

The towns of Hampton and Grand Bay have also adopted this model and together these three communities are the most anaphylaxis ready communities in the country and have already saved lives in the few months they have been available.

Epinephrine auto-injectors save lives and they need to be publicly available.

Sincerely,

Kelly M. Dunfield
